IS IT TIME TO RESIST CALLS FOR MORE MENTAL HEALTH INTERVENTIONS IN EDUCATION?

Dr Jennie Bristow
Senior Lecturer in Sociology, Canterbury Christ Church University
jennie.bristow@canterbury.ac.uk
ResearchEd conference, 9 September 2017
YES!

• Won’t address serious mental health problems among children
• Medicalises wider educational and existential problems
• Displaces teachers and curriculum knowledge
• Promotes a deficit model of students, and a generic culture of behavioural conformity
• ‘Government puts £200k behind plan for mental health first-aiders in every secondary’ TES, 27 June 2017
  
  • The funding will be used to train 3,000 teachers and teaching assistants over the next three years. Teachers will receive practical advice on how to deal with mental health issues such as depression, anxiety, suicide and self-harm. The aim is to extend the programme to primary schools by the end of the current Parliament…

  • Training will be delivered in schools by social enterprise organisation Mental Health First Aid England. Participants will be expected to educate other members of staff in their school about the best ways to handle mental health problems.

  • The programme was first announced by Theresa May in January. Today, she said: “Tackling poor mental health is a huge challenge, and we will keep our promises and meet that challenge with the comprehensive cross-society response that is required.”
Thousands of teenagers will receive additional support to improve their mental health as part of a new youth initiative, the Prime Minister announced on 17 August.

On A Level results day, Prime Minister Theresa May unveiled a new course is to be developed by National Citizen Service (NCS), to raise awareness of mental health among young people and improve their knowledge of how to get help…

The course will be developed with mental health experts and NCS graduates and be delivered as part of the organisation’s programme to prepare young people for the challenges of adult life and work.

The package of measures delivered by NCS will include:

• a dedicated mental health awareness course for teenagers taking part in NCS

• new mental health training for more than 10,000 frontline NCS staff to improve support to young people

• a new network of young NCS graduates to champion mental health awareness
PRIOR POLICY CONTEXT

- Policies designed to promote wellbeing and reduce mental health problems – eg Social and Emotional Aspects of Learning (SEAL)
  - ‘a comprehensive, whole-school approach to promoting the social and emotional skills that underpin effective learning, positive behaviour, regular attendance, staff effectiveness and the emotional health and well-being of all who learn and work in schools’
  - Introduced by New Labour government in mid-2000s at primary and secondary level
- Part of development of generalised ‘therapeutic education’ (Ecclestone and Hayes 2008)
WIDER CULTURAL CONTEXT

• Increasing attention paid to the problem of young people’s mental (ill) health

• Concern about behaviour, attendance, and inclusion

• View of schools as ‘as ideal settings for reaching vulnerable and undiagnosed children and adolescents’ (Lendrum et al. 2013)

• Generalised discourse of ‘vulnerability’ and ‘resilience’, within an overarching ‘therapy culture’
WHAT’S THE PROBLEM?

• Diagnosis of mental ill-health
• Implementation of strategies to address the problem
**Why children's mental health is important**

1 in 10 children and young people experience a mental health issue at any one time.

20,000 young people contacted Childline with suicidal thoughts — that's more than double the number five years ago.

In an average group of 30 15-year-olds:

- 10 are likely to have watched their parents separate
- 6 may be self-harming
- 7 are likely to have been bullied
- 1 could have experienced the death of a parent

---

**YOUNGOV SURVEY, AUGUST 2016**

One in four students suffer from mental health problems.

Stress and anxiety are making day to day life difficult for hundreds of thousands of students.
It is not only the pressures of school and exams, though that is in the front of our minds today, but also self-esteem issues, struggles with home life or friendships, and getting into university or finding a job that can all affect mental wellbeing. Theresa May, August 2017

Perhaps unsurprisingly, study is the primary cause of stress among students. Seven in ten (71%) say that work from university is one of their main sources of stress. YouGov, August 2016

Why children's mental health is important

1 in 10 children and young people experience a mental health issue at any one time

20,000 young people contacted Childline with suicidal thoughts -- that's more than double the number five years ago

In an average group of 30 15-year-olds:

Stress and anxiety are making day to day life difficult for hundreds of thousands of students
THE MORE AWARENESS, THE GREATER THE SCALE OF THE PROBLEM

- IPPR, 2 September 2017

Suicide is at record level among students at UK universities, study finds

Research also finds number of students who disclose mental health problem in first year has risen fivefold in 10 years

CULTURAL SCRIPT OF FRAGILITY

- Assumption that students and young people experience increasing mental health difficulties, requiring a particular (therapeutic) response
- Construction of claims: ‘the meanings that people construct need to make sense of the world they inhabit’ (Best 2008, pp.11-12)
  - Not a ‘made-up’ problem
  - But is this how students and young people are encouraged to give meaning / explanation to existential distress?
  - Do therapeutic interventions work?
• Evaluation of SEAL in secondary schools:

  • ‘In terms of impact, our analysis of pupil-level outcome data indicated that SEAL (as implemented by schools in our sample) failed to impact significantly upon pupils’ social and emotional skills, general mental health difficulties, pro-social behaviour or behaviour problems.

  • In relation to school-level outcome data, our analyses indicated that SEAL (as implemented by schools in our sample) failed to have a positive impact, although the results were less straightforward here. Analysis of school climate scores indicated significant reductions in pupils’ trust and respect for teachers, liking for school, and feelings of classroom and school supportiveness during SEAL implementation. Additionally, qualitative data around perceptions of impact indicated a feeling that SEAL had not produced the expected changes across schools.

  • However, school climate data also showed a significant increase in pupils’ feelings of autonomy and influence, and this was supplemented by anecdotal examples of positive changes in general outcomes (e.g. reductions in exclusion), as well as more specific improvements in behaviour, interpersonal skills and relationships. (Humphrey et al. 2010)
‘Russell Hobby, general secretary of the NAHT headteachers’ union, pointed out that investment in mental health training in schools is only a first step:

“Schools may help in identifying problems, but if the mental health support services are not there, then this is only part of the solution. We know of the long waiting times for child and adolescent mental health services, which must be addressed to give children the support they need.” *TES, 27 June 2017*

Problem of ‘will and skill’ (Lendrum et al. 2013) – but what is right and reasonable to expect of teachers?
OTHER AGENDAS...

**WHY NCS?**

On NCS, your teenager will develop the skills that employers increasingly value: confidence, leadership, and independence.

NCS is a great addition to your teenager’s CV. In fact, almost three quarters (72%) of NCS graduates feel more confident about getting a job after doing NCS. All NCS graduates receive a certificate signed by the Prime Minister, and moreover, UCAS recommends students put NCS in their personal statement.

**NCS LOWERS ANXIETY AND BOOSTS RESILIENCE**

**NCS GRADS ARE MORE CONFIDENT LEADING AND WORKING IN TEAMS**

7 in 10 are more confident about getting a job as a result of NCS.
• Ecclestone and Lewis’s (2014): study of PAThS (Promoting Alternative Thinking Strategies programme) and other school-based interventions for building ‘resilience’ found a number of tensions in the view that ‘vulnerability defines many more people’s everyday experiences than in the past’, including:

  1. It draws in a growing range of mundane, everyday incidents and feelings as threats or risks to emotional well-being and mental health and presents them as needing professionally-led intervention.

  2. It encourages casual references to someone being vulnerable or at risk, or even whole categories of ‘the vulnerable’. In everyday educational settings, such categories and labels apply just as easily to someone facing very serious social and personal difficulties as they do to someone on the brink of a relationship crisis, someone stressed by tests or examinations, risking failure in a module assignment, seeking or being deemed to need ‘learning support’.

  3. A significant expansion of risks and ensuing vulnerabilities seen to need universal support or intervention diverts resources from targeted initiatives to address serious problems for a minority.

  4. Although policy interpretations and attempts to recast vulnerability in progressive ways acknowledge structural forms, they end up being preoccupied with vulnerability as predominantly psychological or emotional, and, from some perspectives, a cultural norm.
Furthermore:

- ‘Although such interventions aim to help children formulate actions, thereby channelling anger and other ‘unhelpful’ responses in productive ways, the emphasis is on emotional regulation and control. Such programmes eschew the possibility of more ‘resistant’ types of resilience…

- Following a Foucauldian argument, confessional and therapeutic strategies require participants to account for and manage themselves as part of new forms of governance that shape desirable citizens…

- In an ethnographic study of SEAL in a primary school, Lisa Proctor illuminates the normative judgements that emerge amongst teachers and other children from one boy’s ‘anger management’ programme, where strategies for the right sort of behaviour are not only scripted but also made public whenever he displays ‘inappropriate’ anger…

- PAThS trains children as peer counsellors or mediators to help peers with identifying and using problem-solving strategies that have been taught in dedicated sessions. An unanticipated outcome revealed by both these examples is the subtle, new forms of peer power and inequality that emerge, where children deemed to be emotionally competent, literate and confident not only gain new advantages but are also deployed to manage other children…. (Ecclestone and Lewis 2014)
CONCLUDING THOUGHTS

- Cultivation of a generalised sense of vulnerability, leading to therapeutic governance and management – and an ever-expanding ‘epidemic’
- Defining everyday distress as a mental health problem can mean it is experienced as such – the ‘self-fulfilling prophecy’
- Wider problems are presented as individual, pathological, in need of and susceptible medical intervention
- Services for those in most need (eg SEN, mental health services) are over-burdened
- (Over)emphasis on behaviour as a cause of harm and a site of regulation
- Teachers distracted from core educational role and expected to behave as (unskilled) clinicians
REFERENCES
